

DEPOT_METRICS

Depot metrics — the ledger

Opened 2026-09-10. **Measure before improving.** One sheet for every number the depot thesis turns on, with each metric defined precisely enough that two entries taken a month apart are comparable.

Status of each instrument is stated, because most are not measurable yet and pretending otherwise is how a plan gets built on a guess.

Metric	Status	Gate
Net per hour driven	live once Checkr clears	background check, 3-10 business days
kWh per revenue mile	live once driving	same
Charging cost, home vs public	partially live now — the public rate is knowable today	home rate needs the property
Turnaround minutes	blocked	needs the property
Charging-position dwell	blocked	needs the property
Curb-to-room minutes	blocked	needs the property and a licence
Semi charging feasibility	blocked	utility service study. Not a measurement — a question for the utility

1 · Rideshare week one — the first real numbers

One row per shift. Nothing here is an estimate; if a cell is unknown, leave it blank rather than filling it.

Definitions. *Revenue miles* = miles with a fare aboard. *Deadhead* = miles without. *Net* = gross earnings minus charging, minus a per-mile wear reserve you set once and do not change mid-week.

Date	Hours online	Total miles	Revenue miles	Gross \$	kWh used	Charge \$	Net \$	Net / hour
------	--------------	-------------	---------------	----------	----------	-----------	--------	------------

Week 1

The question this answers: does an hour of driving clear enough, after energy and wear, to be worth the hour? Nothing else on this sheet matters until it does.

2 · Energy — the number the depot thesis rests on

_____ **Public / supercharger** **Home, off-peak** **Home, on-peak**

\$ per kWh

kWh per revenue mile

\$ per revenue mile

The public column is fillable today. The home columns need the property. **The spread between them is the entire depot argument** — if it is small, home base is a convenience rather than a business case.

3 · Turnaround — the depot's real metric

Not miles driven. Minutes from a vehicle stopping to it moving again with the next payload aboard.

Date **Arrive** **Plugged in** **Payload staged** **Depart** **Turnaround min** **Notes**

Charging-position dwell — hours a vehicle occupies a position while not charging. A position blocked by a full vehicle is a position that is not a depot.

Vehicle **Position occupied** **Charging complete** **Vehicle moved** **Idle-blocked hrs**

4 · Curb to room — the arrival number

*Minutes from a person arriving at the curb to being in their room. **This is a care measurement wearing a stopwatch.*** Every minute of it is spent by someone at the worst moment of their life, in a hallway, in front of strangers.

Date **Curb** **Inside** **Intake done** **In room** **Curb-to-room min** **Path discreet?**

Departure, measured the same way and for the opposite reason. Leaving should be unhurried and visible — the one arrival on this campus that should be slow.

5 • Semi charging — a question, not a measurement

Megawatt-class charging is not a residential service. Before this is planned around, someone at the utility must answer:

- What service currently reaches the property — amperage, phase, transformer rating?
- What would a dedicated 100 kW circuit require, and at what cost?
- Is a transformer upgrade needed, who pays, and what is the lead time?
- What are the demand charges on a commercial rate at that draw?

Unverified and potentially prohibitive. Until these are answered, 04_Tesla_Semi has no home-base assumption in it.
