

EMAIL_DRAFT

Draft — one question to the Utah Highway Safety Office (his send; Zone V identity)

To: Impaired Driving Program, Utah Highway Safety Office (contact on highwaysafety.utah.gov/impaired-driving)

Subject: Measuring a closing-time ride countermeasure — which data would you accept?

I'm scoping a privately funded pilot: a small autonomous fleet reliably positioned at bar closing time in Salt Lake County, with a rural proof on the Wendover-Tooele corridor. Before any car moves I want the measurement designed with you, not around you.

One question: for a before/after comparison of alcohol-involved crashes and DUI arrests in the Friday-Sunday, midnight-3 a.m. window, county versus a matched control county — which dataset and which definition (any alcohol vs $\geq .05$) would your office treat as the number?

If it's simpler in a call, I'll take fifteen minutes. The pilot is owner-funded; I'm not asking for money, I'm asking for the yardstick.

— Joshua
